

File Organization, Organization of Records in Files

- File Organization
- Organization of Records in Files

- The **File** is a collection of records. Using the primary key, we can access the records.
- File organization is used to describe the way in which the records are stored in terms of blocks, and the blocks are placed on the storage medium.
- File organization is a logical relationship among various records. This method defines how file records are mapped onto disk blocks.

Organization of Records in Files

- File organization contains various methods. In the file organization, the programmer decides the best-suited file organization method according to his requirement.
- Types of file organization are as follows:
